There are a lot of articles about sizing type on the web. Many many of them have two things in common; first they point out that typographic points, 1/72nds of an inch, are what's used in print, and second, they don't record why. Typographic points are used for print because they are device independent, allow type to be specified at actual size, and are the only scale I am, or ever have been aware of, that type is designed to. Print layout was and is still done with fonts, page and other measures of size, exactly, so the output would be known in advance, exactly, even before virtual layout of pages on computers. That was and is done with type in 1/72 of an inch. When computers started presenting layout on screens, laser printers and hi-resolution devices, points were converted into the known pixel resolution of devices, and layouts did not change from device to device. The web was launched without a device-independent measure in the 1990's, because many display device did not report their resolution correctly, and no one wanted to, or in some cases could, find out the actual ppi of the display.

The web was launched without a device-independent measure in the 1990's, because many display device did not report their resolution correctly, and no one wanted to, or in some cases could, find out the actual ppi of the display. There are a lot of articles about sizing type on the web. Many many of them have two things in common; first they point

ABCDEFGHIJKLMNOPQRSTUVWXYZ1234567890abcdefghijklmnopqrstuvwxyz.,;:!?&-
CWN FJORD BANK, 203 GLYPHS VEXT QUIZ? Typography is known for two-dimensional architecture and requires extra zeal within every job. Justly vexed, the queen exiled the calligrapher who spattered black sumi ink on her fuzzy dog.

THE BASQUE M.P. LOVED HIS WIFE'S ONYX JAR AND ZINC-LINED KEG. I HAVE QUICKLY SPOTTED THE FOUR WOMEN DOZING IN THE JURY BOX. JUDGE POWER QUICKLY GAVE THE SIX EMBEZZELERS STIFF SENTENCES. MAY BROUGHT BACK FIVE OR SIX DOZEN PIECES OF OUR QUEEN'S JEWELLERY.

There are a lot of articles about sizing type on the web. Many many of them have two things in common; first they point out that typographic points, 1/72nds of an inch, are what's used in print, and second, they don't record why. Typographic points are used for print because they are device independent, allow type to be specified at actual size, and are the only scale I am, or ever have been aware of, that type is designed to. Print layout was and is still done with fonts, page and other measures of size, exactly, so the output would be known in advance, exactly, even before virtual layout of pages on computers. That was and is done with type in 1/72 of an inch. When computers started presenting layout on screens, laser printers and hi-resolution devices, points were converted into the known pixel resolution of devices, and layouts did not change from device to device. The web was launched without a device-independent measure in the 1990's, because many display device did not report their resolution correctly, and no one wanted to, or in some cases could, find out the actual ppi of the display.
